User Limits

Starting Version 5.4, the User Limits have been automated and the associated data table **zxlimits** have changed. You need to drop the old table and recreate it. Important fields are:

- Page: The page name,say, **opord**.
- Command: The command that will be disabled if the value of the limit is exceeded. If restricted to a particular tab, use the form <command-name>|<tab-name>, say, **Approve|Order**.
- Field: The field name whose value is being compared with, say, **xtotamt**.
- Limit: The limit for the value of the Field, say, **10,000**, beyond which the command will be disabled.
